

Announcement

Conference June 18th 2013 12.30 u – 18.00 u

MECC Maastricht, The Netherlands

interRAI: *the* solution for quality and accountability in (forensic) mental healthcare?

In early 2012, the project Forensic Rom was initiated as a part of the Kwaliteit Forensische Zorg program (Quality of Forensic Care). This project includes a series of pilot studies of the interRAI suite of mental health instruments that have been used internationally for ROM. This family of instruments offers promising results when it comes to:

- Monitoring Outcome
- Enhancing accountability and quality of care
- Allocating resources equitably based on an objective method for budget distribution
- Engaging mental health professionals in a collaborative approach to enhance effectiveness of treatment
- Supporting care and exchanging information across the continuum of mental health services

In the last 2 years the interRAI instrument has been extensively tested when it comes to usefulness and added value in the Dutch Forensic mental health sector. These tests have been done in 6 forensic institutions:

- De Rooyse Wissel
- Veldzicht
- GGZ Noord Holland Noord

- Pompestichting
- De Woenselse Poort
- De Waag

Learn all there is to know about the potential of this instrument and the results of the Dutch pilots on this interactive conference on June 18th in Maastricht!

The conference was organized in conjunction with the Forensic Psychology Update conference organized by the University Maastricht. It will therefore be possible to join the morning sessions of this Forensic Psychology Update conference in addition to the interRAI conference. In cooperation with the Maastricht University, we will be offering a special price if you attend both events..

Save this date in your agenda!

We will soon inform you of the final program and registration details.
